LAB #10

Adv. CiC
Spring 2026

Agenda

1. Housekeeping
2. User Testing
3. Performance
4. Data Loading: Recap
5. Lab 10 Exercise

Housekeeping

Due this past week

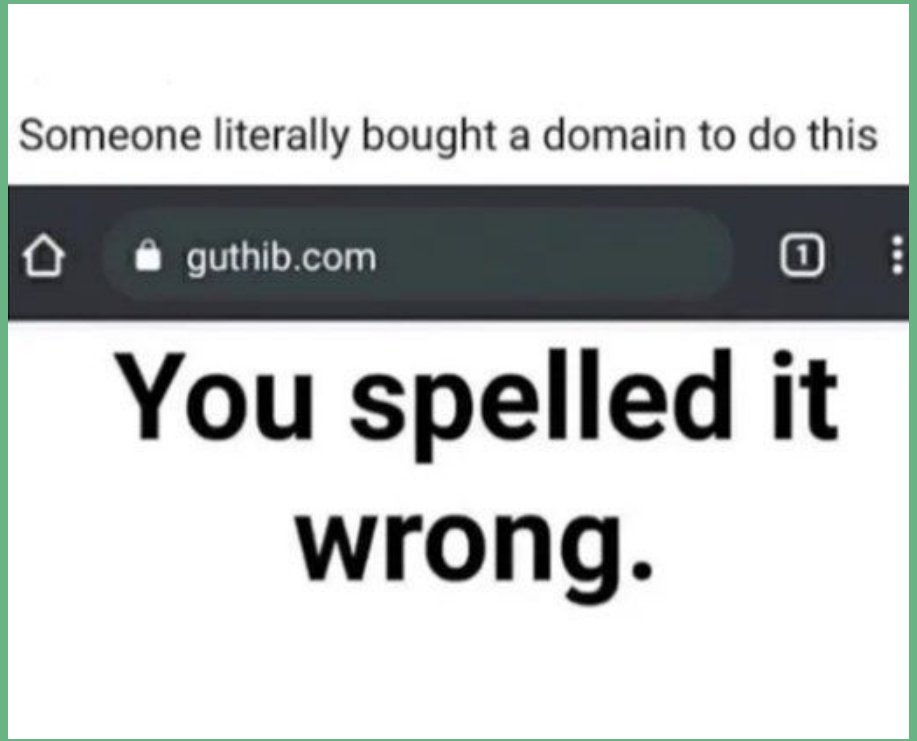
- Project pt. 5
- Lab 8

Upcoming

- Check-in - **4/2 @ 3pm**
- Lab 10 - **4/3 @ 1pm**

Announcements

1. Grading catch-up (sorry!)
2. Check-in updated



Questions

(on Lectures, Labs, or Readings)?

User Testing

What is user testing?

the process of observing people as they use a product to understand what works and what needs improvement

- User testing helps you see how real people **actually** use your product, not just how you **expect** them to use it.
- It reveals confusing flows, unmet needs, and usability problems before wider launch.
- It helps teams build products that are more intuitive, effective, and grounded in actual user behavior.

DOGFOODING

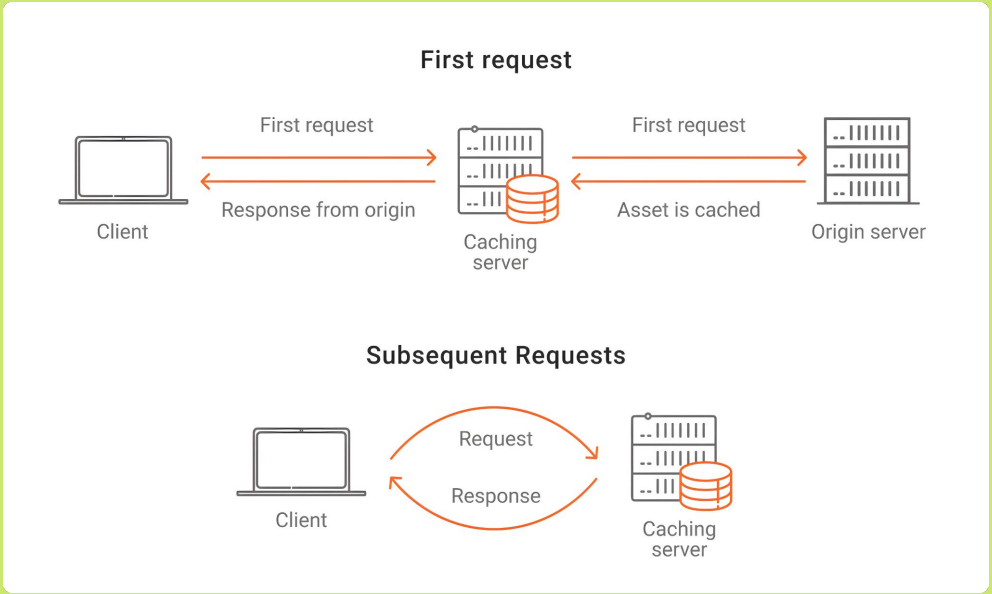
EATING YOUR OWN DOG FOOD

- USING YOUR PRODUCT INTERNALLY
- EXPERIENCING IT AS A USER WOULD
- IDENTIFYING ISSUES AND PAIN POINTS

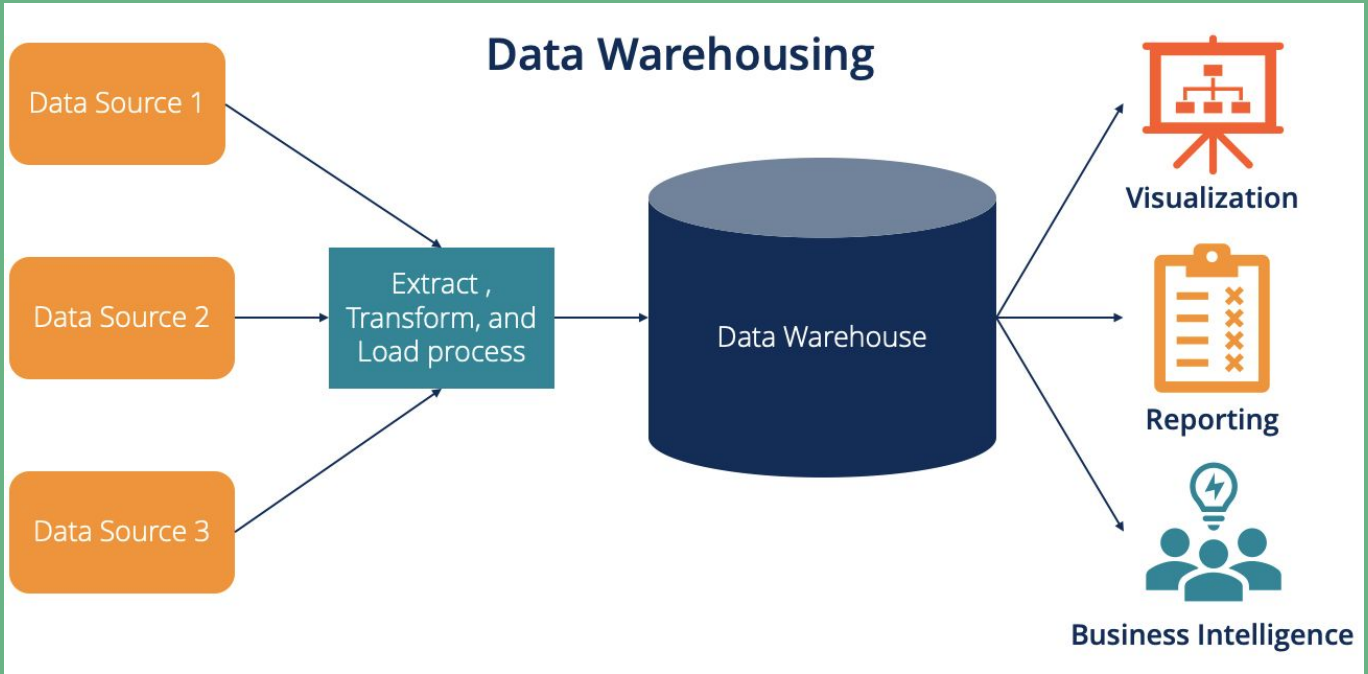
Performance

- **Performance** is important because faster systems make products easier to use and help users complete tasks more reliably.

- **Caching** is storing frequently used data (or results) so it can be accessed or loaded faster the next time it is needed.



Recap: Data Loading



Data warehousing brings together **cleaned, historical data from multiple sources** in one place, making it easier to analyze trends over time and support better decision-making

- **Append load:** adds new records to existing data without changing what is already there
- **Truncate and load:** clears the table and reloads the full dataset from scratch
- **Incremental load:** loads only new or changed records since the last update
